The edit order price by active order sequence number allows the user to adjust the price of an active order, and have the existing order details remain the same. This would be useful for users who wish to adjust the price of an order on the order book despite any previous executions already concluded on that order. 7260

73<u>61</u>

Page 5

7.3.12 Edit order price by user reference number- Message type 172

The edit order price by user reference number allows the user to adjust the price of an active order, and have the existing order details remain the same. This would be useful for users who wish to adjust the price of an order on the order book despite any previous executions already concluded on that order. 7361

3. Intended Audience

This document is intended for review by relevant JSE internal departments as well as external/market review by:

- Equity Derivative Members;
- Agricultural Products Members;
- Clearing Members;
- Public Information Subscribers;
- Software Providers

Please note that while this document is equally important for trading and clearing member firms and their software providers, as well as Information Subscribers.

4. System Description

4.1 Introduction

The new JSE Derivatives Trading System is an exchange layer of markets that allow for the trading and dissemination of multiple product types using one system, through a common API. These products can be diverse, each containing their own set of values. Products are further separated into different markets.

Products do contain links between them to facilitate the trading of spreads and switches (also called splits).

4.2 Connecting to a market

The system consists of several server programs. A set of server programs constitutes a market. Each market has an interface which allows external systems to communicate with it. The protocol used to interface to the system is TCP/IP. Each market may have its own IP Address and Port number.

The programmer who wishes to use this API specification must first ensure that they can establish a streamed TCP/IP permanent socket connection to the appropriate port.

From this point onwards, all communication is done using message packets. Every message packet, either in or out, must carry a **Transport Header**, which consists of 4 bytes. A description of the transport header can be found in **Table 1.1**.

The transport header is followed by a **Message Header**. The message header contains the indication of who the user is, the details of the transaction performed, etc. A description of the Message Header can be found in **Table 1.2**.

4.3 TCP/IP Transport system

The TCP/IP transport system may or may not send a message in its entirety. Due to the nature of the routers, carriers, etc, it is likely that in some cases a message that consists of large number bytes is transmitted in smaller pieces, the length of each being random. The API programmer must ensure the receipt of not only a complete and valid transport header, but also a complete number of message bytes before acting on the contents of the message.

Appendix K - JSE Derivatives Trading System API Document.docAppendix K - JSE Derivatives Trading System API Document.docJSE Derivatives Trading System API Document v2.1 rev2.doc

4.4 Field Formats

Throughout the document the following field types will be referred to:

- I: Intel Integer format; the length is defined
- U: Intel unsigned integer; the length is defined
- D: Intel/IEEE floating point; 8 byte format
- P: Pascal type string with leading length byte, maximum length is the defined length 1. All strings are represented in this manner.

Example:

A string representation of the word MITS into a 6 long field would be sent in the following manner:

0	1	2	3	4	5
4	М	Ι	Т	S	

The system will validate the string only in this context using the byte 0 as the length.

- B: The field is made up of 1 or more bytes of type U
- C: Single character; ASCII equivalent

A field description will also be given which describes the contents:

- A: Alpha only
- N: Numeric only Default for types I.U.D
- AN: Alpha numeric

Time Format

- All times given in this document are given as 4 byte values in the following format:
 - Byte 0 = Hours Byte 1 = Minutes
 - Byte 2 = Seconds
 - Byte 3 = 0

Please Note: Mandatory fields in this specification are market with an asterisk (*). All nonmandatory fields which are not going to be filled in should be sent with 0 for numeric values, and empty strings or padded with null (0) for alpha fields.

4.5 Message Headers

Table 1.1 Transport Header

Name	Length	Comment
Byte 1*	1	255 or FF
Byte 2*	1	Low byte of the message length (not including the 4 byte transport header)
Byte 3*	1	High byte of the message length (not including the 4 byte transport header)
Byte 4*	1	XOR of bytes 2 and 3

<u>3/10/1929/08/1</u> <u>913/07/17</u>9/01/17

Table 1.2 Message Header

Name	Length	Туре	Description	Case	Example	Comment
Sequence Number	4	1	N	n/a	123	Used for message trace purposes. This is a sequence number per socket and is incremented with each message sent.
User Code*	6	Ρ	AN	U	ABMN	Logged in Member Code. This is the member code the user used to log into the system.
User Dealer*	4	Ρ	AN	U	JOE	Dealer code of logged in dealer. This is the dealer code the user used to log into the system.
User Number*	4	1	N	n/a	66	Any user integer. This is kept by the system and returned to the user unchanged.
Market Number*	1	В	N	n/a	3	See Table 1.3
Time*	4	В	N	n/a	11, 56, 55, 0	Time Format: Hours, Minutes, Seconds, 0
Message Type*	1	В	N	n/a	36	Message Number.
Member Code*	6	Ρ	AN	U	ABMN	This is the member code that would be referred to when the exchange handles the message. For information subscribers this must be set to 'DATA'.
Dealer Code/User Code*	4	Ρ	AN	U	JOE	This is the dealer code that would be referred to when the exchange handles the message. For information subscribers this must be set to the user code supplied.

Total Length: 34 Bytes

Note: The Member Code and Dealer Code may differ from the User Code and User Dealer, for example: A Clearing Member acting on behalf of a Member.

Appendix K - JSE Derivatives Trading System API Document.docAppendix K - JSE Derivatives Trading System API Document.doc JSE Derivatives Trading System API Document v2.1 rev2.doc

<u>3/10/1929/08/1</u> <u>913/07/17</u>9/01/17

Data in the message portion of the packet will then follow the Message Header.

Name	Length	Туре	Description	Case	Example	Comment
Message	MAX -	В	AN	n/a		Defined or compressed
	5466					message.

The messages are defined in two groups:

- Input Messages sent by the API user.
- Output Messages sent to the API user.

These defined groups contain message types that can be defined into two further groups:

- Private Messages
 - These are messages that contain confidential information that is specific for an individual dealer or an individual member firm. An example of this is the 123 Message with deal update/insert indicator.
- Public messages
 - These are non-confidential messages that contain information that is market specific and available to all users who subscribe to public data. For example: a last price change on a contract would be received by the whole market. Information Subscribers will be key users of these messages.

These messages are Asynchronous; therefore, they may be received in any order.

All header messages contain a market indicator number; Table 1.3 contains market numbers

Table 1.3 Market Number

Market Number	Market Abbreviation	Full Market Name
1	EDM	Equity Derivatives Market
2	APD	Agricultural Product Division
4	MUT	Mutual Market

4.6 Compression

A large number of the messages contain data which is considered amenable to compression. Therefore, this data is compressed using the LZH algorithm. The data contains an LZH header defining the decompression criteria, and once a complete compressed data string of bytes has been received, it must be decompressed. The structure of the DECOMPRESSED data is given in this document.

Details of the LZH decompression algorithm can be found at the following URL:

http://www.programmersheaven.com/download/2215/download.aspx

Appendix K - JSE Derivatives Trading System API Document.docAppendix K - JSE Derivatives Trading System API Document.docJSE Derivatives Trading System API Document v2.1 rev2.doc

<u>3/10/1929/08/1 913/07/17</u>9/01/17

4.7 Large Data Transmission

Message Packet (Mess	sage Type 123 and 36)		
Transport Header	Message Header	Message Sub Header	Data Section
4 Bytes	34 Bytes	14 Bytes (Section 9.1)	Max 5000 Bytes

Message Packet (Message Type 59)				
Transport Header	Message Header	Message Sub Header	Data Section	
4 Bytes	34 Bytes	1 Byte (Section 8.3)	Max 5000 Bytes	

All Data Sections transmitted to users will have a maximum size of 5000 bytes. When the compressed data buffer is greater than 5000 bytes the system will split this data buffer into a series of Data Sections. These Data Sections will all have a length of 5000 bytes, except the last Data Section which will contain the remainder of the data.

Each data section will then be sent with its own transport header, message header and message sub-header. The message sub-header will indicate if this is the final message of a series. The data will inevitably be in compressed format. Upon receipt of the final message, all Data Sections can be appended and decompressed as a whole.

Only messages 36 (data retrieval), 59 (contract update) and 123 (data update) are compressed, all other messages are not compressed.

4.8 Subscription to Instrument Update Messages

The system works on a subscriber basis for all instrument and depth updates. The user will have to send a subscription request message to subscribe to a contract. The list of all configured and active contracts are available through the API specification using a 36 type message (Section **6.6** <u>Market Display dataMarket Display dataMarket Display data</u>).

In order to subscribe to a contract, the user would send a type 99 message. This message would contain all the contracts for which the user would like to receive updates. In order to unsubscribe from a contract, the user would send in a type 42 message. This message would contain a list of the contracts from which the user would like to unsubscribe.

The result of sending a type 99 message is a type 59 message containing all the details of the instruments the user subscribed to. When an order is added to the instrument or any depth of the instrument changes the user would receive a type 59 message on the instrument with the updated details automatically. Thus the user only has to subscribe to the instrument once and thereafter they would receive all updates to the instrument. This has to be done for each session.

Subscription is per instrument, date, and expiry and not on the instrument alone. For example the user has to subscribe to DEC 2010 FBWC and not just the FBWC instrument. For more information on contracts see Section **6.6** <u>Instrument, Date and Strike</u> <u>SequencesInstrument, Date and Strike</u> <u>Sequences.</u>

4.9 Acknowledgement of messages

Appendix K - JSE Derivatives Trading System API Document.docAppendix K - JSE Derivatives Trading System API Document.doc_JSE Derivatives Trading System API Document v2 1 rav2 doc

Page 40

Formatted: Font: Bold
Formatted: Font: Bold

Formatted: Font: Bold

Formatted: Font: Bold

The system is transactional and asynchronous. This means that no ACK or NACK is sent on the application layer to confirm the receipt of messages. Instead a transaction response is sent when a message has been processed by the system.

There are three types of transaction responses:

- 123 Message (Data update)
 - This is the positive response to the transaction. The data in the message informs the user of the data change and the action taken on the data i.e. Insert, Update or Delete.
- 59 Message (Contract update) •
 - This is the positive response to the transaction. The data in the message contains the updated instrument information and depth on the instrument.
- 125 Message (Error and information messages). .
 - These responses are either negative or positive. A list of common messages can be found in Section 11.

In all these message types the Sequence Number in the message header is incremented by each send to the specific socket.

4.10 Complex Instruments

Complex instruments are two contracts that are grouped together to make up one contract. The following Complex Instruments can be traded:

- Spread •
 - A Spread is a contract that constitutes one instrument and two expiries. 0
 - Example: a spread can be traded between the DEC 2007 FBWC and the 0 FEB 2008 FBWC contracts
- Switches •
 - 0
 - A Switch consists of 2 different instruments with the same expiry date. Example: a switch is contract that is traded between the **DEC 2007 FBWC** 0 and DEC 2007 ALSI contracts.

User Sends Message Type 121		
	←	Any Price Update for the contract specified will be returned as Message Type 59

4.12 Authorisation of messages and Initial Margin Limits

This section does not apply to information subscribers, as the exchange will authorise subscription to messages for information subscribers.

The system contains levels of authorisation that defines which messages are accepted by entities. (Please see Message Type 7) It also contains authorisation for initial margin limits for each entity (Please see Message Type 6).

The levels of authorisation are as follows starting from the top entity:

- The Exchange
 - The exchange can control all the entities and set all entities' limits and access rights.
- The Clearing Member
 - The Clearing Member limits are set by the exchange; they can lessen the limits set by the exchange but cannot exceed the limits.
 - $\circ~$ The Clearing Member can set limits for all members and member branches that belong to this clearing house.
- The Member / Member Branch
 - The compliance officer for this member can set limits for all dealers on his trading floor.
 - The compliance officer cannot increase any dealer limits higher than their own.
- The Dealer

 Appendix K - JSE Derivatives Trading System API

 Document.docAppendix K - JSE Derivatives Trading
 3/10/1929/08/1

 System API Document.doc_JSE Derivatives Trading
 913/07/179/01/17

 System API Document.v2.1-rev2.doc
 913/07/179/01/17

 $\circ~$ The dealer can set their own limits lower than what was assigned to them, but not higher.

Limits include messages that are allowed to be sent to the exchange and initial margin limits Example A:

- 1. The exchange sets a clearing members initial margin limit at R100
- 2. The clearing member can alter the limits of his members to R50 each. He cannot set it higher than his limits of R100.
- 3. The compliance officer can set each of the dealers on the floors limits to R30, but not higher than his limit of R50.

Example B:

- 1. The exchange sets the limits for a clearing member and allows him to insert and verify the loading of a client.
- The clearing member does not want his members' dealers to verify clients as he would like to do this himself, but does allow them to insert the client.
- 3. He thus restricts his members' dealers to only use the insert client message and not the verify message.

4.13 Market Data levels on 59 and 99 messages

This section only applies to Information Subscriber users.

The system allows for 2 levels of subscription for the screen update message (59).

- Level 1 Best Bid or Offer (Allows the user to only see the top of the depth)
- Level 2 Full Depth (Allows the user to see the full depth on a contract)

These levels are setup by the Exchange on the subscription profile of the user. The message received by the user is the same in both cases only the number of depth items changes.

4.14 Principle Agency indicator

Each deal must contain a Principle/Agency indicator. This indicator shows the intention of the deal booked. This indicator has to be sent through in all insert messages of orders and report only deals.

The rule for Principle and Agency is the following.

- An 'A' Agency or 'P' Principle has to be specified on inserting an active order, and on the report only deal entry.
- Agency and Principle deals cannot be accumulated together.
- On Agency trades the price cannot be changed when assigning a deal.
- On Principle trades the price can be changed when assigning a deal.

4.15 Servicing message from TCP IP

Under high amounts of volume, it is imperative that users service the messages from their TCP/IP socket in an efficient manner. The exchange system has controls in place to ensure that users who are not servicing messages in an efficient manner, and thus causing their queue on the communications layer of the exchange system to build up, are disconnected to avoid a build up of pending messages.

A recommended solution to this would be to remove messages from the socket as soon as they arrive, and create an application resident queue of messages. This application resident queue can then be used to process messages. This will then send acknowledgement of

 Appendix K - JSE Derivatives Trading System API

 Document.docAppendix K - JSE Derivatives Trading

 System API Document.v2.1 rev2.doc
 913/07/179/01/17

receipt of the message to the exchange system as soon as messages arrive, and avoid the potential of being disconnected.

4.16 Anonymous Trading – ADDED to API Version 2 published on 18 February 2009

Some instruments will be listed as anonymously traded instruments. The Contract Date download message (Download Message Number 3) includes flags (Future Anonymous and Options Anonymous) to identify the anonymously traded instruments.

The Display Update Messages (59's) published on these instruments will be flagged as anonymous, and the member codes previously displayed will not be published.

The member codes on these display updates will be replaced with uniquely identifiable numbers. Each user will be assigned a number upon login, and this same number will be present in the display update messages. This will allow users to identify their own orders in the market depth.

To cater for anonymously traded instruments user will need to cater for changes to the following messages:

- Change to login response message (Message 1)
- Change to display update message (Message 59)
- Change to contract dates data download message (Message 3 download structure)

4.17 Mutual Market Access – from Version 2.1

Revision 2.1 of the API specification enhances the Mutual Market access to members of the Equity Derivatives and Commodity Derivatives divisions of the JSE.

Mutual Market access is now facilitated via their existing connection to either the Equity or Commodity Derivatives Markets.

The mutual market is therefore no longer a separate instance, but rather a subset of contracts available for trading on either the APD or EDM connection.

The following points should be noted:

Download notes

- The download of transactional data (i.e. active orders, unmatched deals, completed orders, deals, positions) will only be provided from the market on which the principle on transactional has elected to clear their mutual market in.
- To provide easier access to data, requests downloaded from the primary markets will be inclusive of the mutual market data. For example the download of MTM data, when requested from primary market will include primary market as well as mutual market entries for MTM data. (The primary market is defined as either Equity Derivatives or Commodity Derivatives). This holds true for the following data requests:

Appendix K - JSE Derivatives Trading System API Document docAppendix K - JSE Derivatives Trading System API Document 40c JSE Derivatives Trading System API Document v2.1 rev2 doc

First Trade of the day	103

Intraday File Update notes:

- When connected to only one market e.g. EDM and placing an order on a mutual market listed contract, the file update message will be returned to the market the user is connected on.
- When connected to both markets (EDM and APD) as the same user code (e.g. SAFMMAT), and an order is placed on a mutual market contract on the EDM connection, the file update will be returned on both the EDM and APD connection. This is inline with the above download notes, i.e. mutual market data is made available on both download and intraday updates on both markets.
- Mutual market data included in both intraday file updates (123) and public data broadcasts (59) will have Market Number 4 set in the header of the message received. This will allow users to identify the source of the data as the mutual market.

4.1114.17 Automated Applications connecting to NUTRON

Any applications used for market making or algo trading purposes must be declared as such before connecting them to the JSE environments.

Applications used for automated trading/quoting activity should make use of the single bid / offer per principal functionality to prevent excessive cancellation of order messages into the exchange. See section 7.3.4 and the Cancel Flag field in the Insert Order Structure.

Further the JSE requests all applications of this type to be linked to a user code that is flagged as a Market Maker account. The Market Maker flag changes the behavior of the API slightly. The flagging of the user code as a Market Maker can be requested from the JSE at any time.

Please refer to example below for details:

1. Orders

- a. Active order confirmations will be sent to the user as per normal.
- b. The Active Order Sequence number sent is an official record of the receipt of the active order, and can be used to cancel or replace the active order.
- c. When logging out, the setting "Delete orders on lost connection" is enabled by default, regardless of the user's login message. Therefore any log out, or lost connection will result in all the users active orders being cancelled from the order book.
- 2. Matching of active orders
 - a. Active orders placed by the users which result in a match will be cancelled, and a new "physical" copy of this active order will be issued.
 - b. The above means that a new active order sequence number will be generated, and sent to the user, and this active order sequence number will be recorded as the matching active order.
 - c. An active order delete message (123) will be sent for the previous active order.
 - d. Consider the below example:
 - i. Active Order is placed to Buy 100 DEC ALSI at 2500
 - ii. In reply active order sequence number 1 is returned by the exchangeiii. Another user then trades this active order.
 - iv. A 123 Delete message will be sent for active order sequence number 1
 - v. A new physical copy of this active order will be recorded in the database, and a 123 insert message for sequence number 2 will be sent to the user, with a copy of the details from sequence number 1.
 - vi. A 123 insert message for completed order, deal and/or position will be returned to the user.
 - vii. A 123 delete message will be sent for sequence number 2, to indicate that it has matched.

4.1124.18 Market Shard Implementation – from Version 2.1

In order cater for higher order throughput on the NUTRON exchange system, multiple instances of the trading system will be deployed. As a result multiple trading engine shards per market will host different instruments. This has no impact to message processing for the user, besides the impact to the depth re-request message (message type 3).

The market depth data message (Display Update Message Type 59) currently contains a Global Sequence Number. This is a sequential message for display updates for a particular market. With the introduction of market shards, this global sequence number changes its scope to **be sequential per market shard**.

The depth re-request message allows the user to re-request market depth data for a market. With the introduction of multiple shards, this now means that data will be returned per market shard, and the re-request message is required to change to facilitate the request per market shard.

The market shard number in the re-request message will identify the market sub set on which particular contracts can be found. This will match up with the market shard number on the Instrument Data download, and therefore Instruments can be mapped accordingly to a particular market shard.

PLEASE NOTE: The exchange may at any time change the market shard definition of an instrument, and it is the users responsibility to handle this change without prior notice by the exchange, by referring to the correct shard number in the Instruments Data Download. A change like this will typically be facilitated overnight with relevant notification given.

 Appendix K - JSE Derivatives Trading System API
 3/10/1929/08/1

 Document.docAppendix K - JSE Derivatives Trading
 3/10/1929/08/1

 System API Document.doc/SSE Derivatives Trading
 913/07/179/01/17

 System API Document.v2 1 rev2 doc
 913/07/179/01/17

On go live of the solution it is envisaged for the Equity Derivatives Market to consist of 3 shards, while the Commodities Market will remain as a single trading engine for the time being.

Note regarding sequence number used for 123 messages

To avoid duplication of sequence numbers for transactional data (i.e. Active Orders, Deals, Completed Orders, and Unmatched) across different shards, the sequence number used for each of these data files will begin in a separate range from other shards. This will be done by ensuring the above file types are sequenced by their shard number * 100 000 000.

e.g. Active orders for contracts on shard 3 will have sequence numbers in the range of $300\ 000\ -399\ 999\ 999$. And completed orders on shard 1 will have sequence numbers in the range of $100\ 000\ -199\ 999\ 999$.

If at any point this range is exhausted the range will restart from shard number * 100 000 000.

5. Log In Process Message

5.1 Establish a connection to the market

Refer to Section 4.2 for protocol details.

The user must create a TCP/IP socket and attach this to the listening market, using the appropriate IP Address and Port number. This connection must be maintained throughout the life cycle of the session. Any break in this connection would be seen as an irregularity in the system and the user would be removed from the market at the exchange's end.

5.2 Market encryption key

When the system accepts a new connection a message (type 16) will be generated and sent to the user who established the connection. This message contains the normal headers. The data part of the message contains a key for the session.

5.3 Sending the login message

When the session key is obtained the user can send their login message. The structure of this message is defined in section **7.1.2 Log in Message**. An example of this log on message is provided in table 2.1.

Table 2.1

Field	Example	Description
Working Directory	C:\Derivtrading\	The working/running directory of the application. This is used for tracking and user assistance.
Company Code*	APIUSER	The code of the company developing the software that is logging in. The exchange will assign this code to the developing software company after conformance test.
Version*	1.0.0.1	The version number of the application. This is user defined.
View All Dealer Data*	1	Compliance officers of a member firm can use this to get information on data for other dealers in the firm.
		If this is set to true the user logging in will receive all deals, orders, completed orders and unmatched deals from all dealers in the member firm
Delete Orders on lost connection**	1	If this field is set, the system will delete all orders when a socket error is received from the user.
		* This is not needed for Information subscribers.
Encrypted password*	#@\$#@\$	See description below.
Active Directory User Name*	APIUSER	See description below.
Domain*	JSE	See description below.

Appendix K - JSE Derivatives Trading System API Document.docAppendix K - JSE Derivatives Trading

<u>3/10/1929/08/1 913/07/17</u>9/01/17

System API Document.docJSE Derivatives Trading System API Document v2.1 rev2.doc

5.3.1 Encrypted Password, User Name and Domain

- The Encryption Key Buffer is made up of:
 - Session key + Member code + Dealer code + Password
- The Data Buffer is made up of:
 - Member code + Dealer code + Session key
- The encryption key is used to encrypt the data, which is then sent in the Encrypted Password field.
- The system will reply with a login acceptance message. (Refer to Message type 1) if authentication succeeds.
- If the system does not authenticate the user an error message will be sent. The user is then restricted to only changing their password. After the user has done this successfully, they can login again using the same session key.

When encrypting the password it is important that the buffers used to hold the key and data are 0 filled for unused characters, as the blowfish algorithm uses block sizes of 8 bytes. Thus a password of length 11 will encrypt to 16 bytes, and the 5 unused bytes need to be null or 0. No string encoding should be performed on either the Encryption Key Buffer, Data Buffer or resulting Encrypted Data Buffer – these should be maintained as raw arrays of bytes at all times.

Please note that the data buffer length should be set to a multiple of 8 bytes to cater for the block size of the algorithm, and should be padded with 0 byte values for the complete length. The key buffer length should be kept as the length of the parts which make up the key, and no padding is required.

Please note that the member code and dealer code / user code are applicable to all API users, not only to trading participants. In the message header, the member code field for Information Subscribers must be 'DATA', the user code that the Exchange supplies must be filled into the user code field in the login message.

The password must comply with the following standards:

- Minimum length 8 characters
 - Complexity: Any three of the following four:
 - Uppercase
 - Lowercase
 - o Numeric
 - o Special character

5.4 I'm Alive

The system will transmit to the API user an '*I'm alive*' message (message 10, **Section 8.5**). This will only be transmitted if no message has been sent from the system to the user in the last 45 seconds, or a pre-configured amount of time set by the Exchange.

The API user must send a Heart beat message (message 84, **Section 7.9**) to the system if there has not been a message sent from the user in the last 45 seconds, or a pre-configured amount of time set by the Exchange.

Appendix K - JSE Derivatives Trading System API Document.docAppendix K - JSE Derivatives Trading System API Document.docJSE Derivatives Trading System API Document.v2.1 rev2.doc

<u>3/10/1929/08/1</u> <u>913/07/17</u>9/01/17

6. Data Sources

Data can be requested from the system by sending a request message (See 6.3 <u>Requesting</u> <u>DataRequestingDataRequestingData</u>). Aseries of compressed message packets will be sent to the user in response to the request. Each of these packets will be preceded with a Transport Header, Message Header and Request Data Header. (See Section 4.7 for the handling of the response)

In the Request Data Header (**Section 9.1**) the Data Type defines the structure of the data. The size of the decompressed data will be a multiple of the size of the defined structure. This decompressed data can therefore be type cast into a series of records.

Example:

- 1. Request data for MTM File (Type 16)
- 2. Received a complete data buffer of 414 bytes (After decompression).
- 3. Number of records contained = Length of Decompressed Buffer (414) / Size of MTM Structure (46) = 9
- 4. 9 Records returned by Download.

6.1 Historical Data

Data can be requested for the previous business day. The Data Request message contains a date parameter, and must be set to download data for the required date.

Table 4.1 contains a reference to data sets available for historical data retrieval.

6.2 Error and Information Messages

IT IS SUGGESTED THAT THE API USER ENSURES THAT THE ERROR AND INFORMATION MESSAGE (TYPE 125) HAS BEEN CATERED FOR, AND HANDLED.

These messages are sent to users specifically when;

- An error occurs as a result of a message sent
- · When a requested process cannot be completed,
- When the exchange wishes to make an announcement of any sort.

Certain announcement messages are generated automatically by the system, for example, warnings on market open, auction start, etc. These messages contain an integer field indicating the error number, this is followed by a byte field indicating if the message is an error message or a information message. These fields are followed by the messages in text format. The exact text of the message may vary as the message may include contract information.

(Refer to Error and Information Messages see Section 11)

6.3 DOS Date Format

This format is the compressed DOS 2 byte date (ISO 8601 MS theta-1980) consisting of 16 bits where the day is stored in bits 0-4, the month in bits 5-8, and the year, with base of 1980, is stored in the remaining bits.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Day					Mont	th			Year						

This is the equivalent of a small integer (date).

The standard formula for calculating a DOS date format is:

todaydate = ((Year - 1980) * 512) + (Month * 32) + (Day);

The formula for decoding the dos date is:

```
int day = date & 0x1F;
int month = (date & 0x1E0) >> 5;
int year = ((date & 0xFE00) >> 9) + 1980;
```

6.4 Requesting Data

There are several different data retrievals that have a data type associated with them. Once the data has been requested a 36 message(s) is returned with the requested data. See **Section 4.7.**

To obtain a data download, 256 is added to the Data Type field. For example referring to the 36 message above the Data Type for Active Orders is a 5. A 36 request for a Data Type 261 will be sent to download the Active Orders data.

6.5 123 Messages vs. 36 Messages

The 123 and 36 Messages are received when downloading or receiving private and public data from the exchange.

Updates or inserts are received intra-session with message type 123, which always contains only one record.

When an input message 36 is sent; messages containing multiple records can be received.

NOTE: Data retrieved when input message 36 is sent is identified by the Data Type + 256, whereas Data received via the 123 message is identified by Data Type without the 256 addition.

Example:

When a 36 Message is sent to the exchange containing data set Number 257 (Market Display), multiple records will be received.

During the trading session a 123 Message (Data Update) can be received containing data type indicator Number 1 (Market Display). This will only contain one record, an insert, update or delete for the display data.

Example:

On a Report only Deal insert message, the user would receive a 123 message with indicator set to unmatched and action set to insert.

6.6 Market Display data

To facilitate the ease of trading, a data set is available through the API specification that contains the entire set of contracts available for real-time trading on each market. The Market Display data contains all relevant links of each contract (Instrument, Date and Strike Sequences. See **Section 6.6**). The market display data also contains the information for that contract that is relevant for trading of the contract in the current market session.

Appendix K - JSE Derivatives Trading System API Document.docAppendix K - JSE Derivatives Trading <u>3/10/19</u>29/08/1 913/07/179/01/17 System API Document.docJSE Derivatives Trading stem API Document v2 1 rev2 doc

The data set structure is available for retrieval as a Message 36 in Request Data Header – Message Type 36 and 123.

6.7 Instrument, Date and Strike Sequences

The system defines contracts by an Instrument, Date and Strike Sequence. These are all linked (Display Data Set) and together define a contract. Each sequence refers to a specific record within a data set that holds information about a specific Contract. For example the instrument sequence number can be linked to the instrument data set, and the instrument data set contains all the relevant information of that instrument.

Each combination of instrument, date and strike sequences is an individual and unique contract.

The **Instrument** refers to the underlying type. These values contain information about the instrument.

The **Date** refers to the expiry in the Contract. This contains information that is specific to this expiry date.

The **Strike** refers to the option on the Contract. If the strike sequence is zero the contract is a Future, otherwise the contract is an Option. The strike contains the information for the option or delta.

Example table of instrument, date and strike sequences used:

INSTRUMENT	DATE	Strike	CONTRACT CODE	DESCRIPTION
ALSI	DEC 2006	SS 0	FZ615 ALSI	Future
IS 1	CS 1			
ALSI	DEC 2006	1500 Put	YZ615 ALSI	Option
IS 1	CS 1	SS 1	1500 P	
ALSI	DEC 2007	1500 Call	YZ715 ALSI	Option
IS 1	CS 2	SS 2	1500 C	
ALSI	DEC 2007	SS 0	FZ715 ALSI	Future
IS 1	CS 2			
FBWC	DEC 2006	SS 0	FZ615 FBWC	Future
IS 2	CS 3			
FBWC	DEC 2006	1500 Put	YZ615DFBWC	Delta Option
IS 2	CS 3	SS 3	1500 P	
FBWC	DEC 2007	1500 Call	YZ715DFBWC	Delta Option
IS 2	CS 4	SS 3	1500 C	
FBWC	DEC 2007	SS 0	FZ715 FBWC	Future
IS 2	CS 4			

The date sequence 1 is connected to the ALSI instrument and is a date of the ALSI. The FBWC instrument will have its own set of date sequences. Data sequences are not interchangeable on instruments as they contain information relating to an instrument for the expiry.

Complex instruments are linked in a similar fashion. An extra set of sequence numbers is available in the Market Display data set called Second Instrument Sequence and Second

Appendix K - JSE Derivatives Trading System API <u>3/10/1929/08/1</u> <u>913/07/17</u>9/01/17 Document.docAppendix K - JSE Derivatives Trading System API Document.docJSE Derivatives Trading stem API Document v2.1 rev2.doc

Date Sequence, using the table below and the following complex instruments will be created by the system:

INSTRUMENT	SECOND INSTRUMENT	DATE	SECOND DATE	Strike	CONTRACT CODE	DESCRIPTION
ALSI IS 1	ALSI IS 1	DEC 2006 CS 1	DEC 2007 CS 2	SS 0	ZZ6Z7 ALSI	Spread between DEC 2006 and DEC 2007 ALSI
FBWC IS 2	FBWC IS 2	DEC 2006 CS 3	DEC 2007 CS 4	SS 0	ZZ6Z7 FBWC	Spread between DEC 2006 and DEC 2007 FBWC
ALSI IS 1	FBWC IS 2	DEC 2006 CS 1	DEC 2006 CS 3	SS 0	XZ6Z6 ALSI/FBWC	Switch between DEC 2006 ALSI and FBWC
ALSI IS 1	FBWC IS 2	DEC 2007 CS 2	DEC 2007 CS 4	SS 0	XZ7Z7 ALSI/FBWC	Switch between DEC 2007 ALSI and FBWC

Contract **Inheritance** flows from the instrument to strike. Thus the valuation date on the strike will override the expiry date on the contract date.

The contracts available on the market and the sequence numbers that make up the contract are available in the Market Display Data.

6.8 Entity Codes

The following Entities used currently exist in the system:

- Member
 - o Members are 5 byte long Pascal type strings
 - Example: ABCD
 - Dealer o Dealers are 4 byte long Pascal type strings
 - Example: JOE
 - Clients

•

- \circ Clients are 7 byte long Pascal type strings. 3 Alpha, followed by 3 numeric characters
- o Example: CLI001
- Sub-Accounts
 - \circ Sub-accounts are 6 byte long Pascal type strings, that do not end in 'C'
 - Example: SUB99
- Clearing Members
 - Clearing members are 6 long Pascal type strings
 - \circ Clearing members always end with a character C in byte 5
 - Example: ABCDC

6.9.4 Day Convention

Appendix K - JSE Derivatives Trading System API Document.docAppendix K - JSE Derivatives Trading System API Document.docJSE Derivatives Trading System API Document v2.1 rev2.doc

<u>3/10/1929/08/1</u> <u>913/07/17</u>9/01/17

Note: When the contract code refers to a complex instrument (referring to 2 contracts), the 'day' field is not used. This is retrieved from the underlying contract dates that make up the complex instrument.

CHARACTER	DAY	POSITION	EXAMPLE
XX (where XX equal days of the month and XX is <= to 31)	27	4 & 5	FG4 27 ALSI

6.9.5 Contract Code Description and Implementation

The contract code will be presented in the following format in all contract code fields. The format is give as:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
%	Т	М	Υ	D	D	d	С	С	С	С	S	S	S	S	S	S	S	S	С

% - Length of the contract code string

- T Instrument Type (See 6.9.1)
- M Month Character (See 6.9.3)
- Y Year Character (See 6.9.2)
- D Day Characters (See 6.9.4)
- d Delta Option indicator
- C Instrument Name
- S Strike Value
- c Call or Put Indicator

The following are some examples:

6.9.5.1 Future Contract (May 2007 ALSI)

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19
10	F	К	7	2	1		Α	L	S	Ι									

6.9.5.2 Naked Option Contract (May 2007 ALSI 26 000 Call)

6.10 Origin field Descriptions

Appendix K - JSE Derivatives Trading System API Document.docAppendix K - JSE Derivatives Trading System API Document.docJSE Derivatives Trading System API Document v2.1 rev2.doc

The Origin field is an indicator of the process that was followed which caused an unmatched trade, trade or completed order. For example if the origin is Accumulate it then indicates that the trade is the result of an accumulation.

NAME	CHARACTER	DESCRIPTION
None	· · - bvte 32	No activity recorded on trade
Accumulate	A Dyte 32	Trade Accumulation occurred with this trade as
		result
Principle Change	D	A trade was split with a change in the principle from the original
Assign Send	Q	This trade has been assigned
J. J		This trade cant be accumulated, assigned or split again
Assign Receive	F	This trade is a result of a trade that was
		assigned to another party, and this is the opposite leg generated.
Rolling forward	R	This trade is a result of a roll forward on a
position		position.
Tripartite Receive	Т	This trade is the result of a tripartite allocation
		forward leg.
On Screen	0	This trade is the result of an On Screen trade
Report Only	P	This trade is the result of report only trade that
. topont only		occurred
Sub Account	S	This trade is the result of a sub-account
Modification		modification
Option Exercise	E	This trade is the result of a option exercise
Option Abandon	B	This trade is the result of a option abandon
Tripartite Send	W	This trade was allocated to the client of another
Thpartite Seriu	vv	member.
		This trade cannot be assigned, accumulated,
		split or used in another tripartite allocation
Allocate Send	1	The trade was used in a split transaction.
Allocate Certu		This trade cannot be accumulated, split again,
		used in a tripartite allocation or assigned.
Allocate Receive	М	This trade is the client's leg of a split or
	111	allocation. This trade cannot be split again.
Corporate Action	С	This trade is the result of a corporate action.
Sub Account	Н	This indicates that a sub account has been
Change	11	changed on a trade leg.
Allocation Error	G	This indicates that this trade has been corrected
	0	as the client was incorrect
Allocation	1	This indicates that this trade is a correction trade
Correction	1	for a client trade which was booked incorrectly
Principle	N	This indicates that this trade is a correction trade
Correction		for a client trade that was booked incorrectly and
Conection		subsequently moved back to the member's
		account.
Transfer	К	Indicates this trade was as a result of a transfer.
Report Only After	8	Is to be used for input purposes only when
Roll	0	reporting Roll Over Trades. Please see
NUI		"Reporting Roll Over Trades" (pg 53) for
		additional details.
Report Only	U	Origin indicates the trade is a report only
Correction	0	correction.
Report Only	V	Origin indicates the trade is a report only
Cancellation	v	cancellation
Cancellation		cancellation

Delivery	6

7. Input Messages

7.1 Connection Messages

7.1.1 Encryption

The encryption method used is Blowfish. The following URL can be referenced for example and explanations for the blowfish encryption methodology.

http://www.schneier.com/blowfish-download.html

Encryption is required in the following two scenarios:

- When the API user sends a Login Message (Message Type 0) ٠
- When the API user sends a Password Change Message (Message Type 88) •

The encryption algorithm uses the following values:

- Hash Mode: Sha1
- Cipher Mode: Blowfish is a variable-length key block cipher •
- Block size: 8 bytes 64 bits •
- Max key: 56 bytes 448 bits •

Test vectors are available on the following website for testing purposes: http://www.schneier.com/code/vectors.txt

Some samples from this website include:

Key Used	Bytes Encrypted	Encrypted Bytes
0000000000000000	00000000000000000	4EF997456198DD78

connection*						disconnects, or loses connection from the exchange
Encrypted password*	24	В	N	n/a	"@!#%@#"	See description below
Active Directory User Name*	255	Ρ	AN	n/a	APIUSER	The Active Directory user name assigned to you by the exchange
Domain*	255	Р	AN	n/a	JSE	The domain name assigned to you by the exchange.

Total Length: 821 Bytes

Encrypting the password:

- The Encryption Key Buffer is made up of:
 - Session key + Member code + Dealer code + Password
- The Data Buffer is made up of:
 - Member code + Dealer code + Session key
- The encryption key is used to encrypt the data, which is then sent in the **Encrypted Password** field.

7.1.3 Log out Message – Message type 4

- This message does not contain any details.
- The exchange will log the user out of the market, and if "Delete Orders on Lost Connection" is selected in the login message, all active orders on the market would be deleted.
- 7.1.4 Re Request Message type 3

Re Request of 59 messages. The Display Update (Message Type 59) contains the sequence numbers required to facilitate this request. The From Sequence and To Sequence are both inclusive in the result set. The exchange will reply in result sets of 100 sequences at a time, for the supplied sequence number range.

When the user is disconnect, and re-connects they are advised to re-request missing messages starting with the last global sequence number received. This is to ensure that any updates to the last global sequence number received are taken into account.

The user is also advised that live messages should be received in conjunction with the response to re-requests. This is to avoid missing live messages whilst re-requests are being received.

It is also advised that if a sequence number is received out of order, the user should build functionality that manages any triggers for re-request. This functionality could potentially make use of a counter that only after 3 checks, triggers a re-request for a missing sequence number. This will cater for the possibility that a sequence number is received out of order due to message routing or other factors, and allow the user to ensure all data is received in good order.

The market shard number will identify the market sub set on which particular contracts can be found. This will match up with the market shard number on the Instrument Data download, and therefore Instruments can be mapped accordingly to a particular market shard. PLEASE NOTE: The exchange may at any time change

 Appendix K - JSE Derivatives Trading System API

Sequence*						number
То	4	1	N	n/a	112	To this sequence number
Sequence*						
Market	4	I	N	n/a	1	Indicates the market
Shard						shard number on which
Number						you would like to re-
						request data from.

Total Length: 12 Bytes

7.1.5 Password Change Message – Message type 88

The password encryption works similarly to the login password except that the new and old passwords are the encrypted data that is transferred.

The following are NOT length prefixed:

- Session Key
- Member Code •
- Dealer Code •
- Old Password •
- New Password ٠
- Key Buffer •
- Data Buffer
- Encrypted Result •

The process is as follows for encrypting the old password.

- Key Buffer: Session key + member code + dealer code + old password
- 0 Data Buffer: old password
- The encrypted result is then sent in the Old Password field. 0

- The process is as follow for encrypting the new password. Key Buffer: Session key + member code + dealer code + old password
 - 0 Data Buffer: new password
 - o The encrypted result is then sent in the New Password field.

Name	Length	Туре	Description	Case	Example	Comment
Old Password*	24	В	AN	n/a	@@#*%	The previous password
						in encrypted format.
New	24	В	AN	n/a	%%@&\$	The new password in
Password*						encrypted format.

Directory User						user name assigned to
Name*						you by the exchange.
Domain*	255	Р	AN	n/a	JSE	The domain name
						assigned to you by the
						exchange.

Total Length: 558 Bytes

7.2 Subscription Messages

7.2.1 Unsubscribe Contract – Message type 42

To inform the system that the user no longer wants to receive Display Updates on a particular contract, a user must send a Message Type 42 with the list of contracts that they wish to unsubscribe from. This message caters for up to 40 contracts per message. To unsubscribe to all options on the market, the message can be sent with a quantity of 1 and an empty list of contracts.

Name	Length	Туре	Description	Case	Example	Comment
Quantity*	2	1	N	n/a	3	Number of contracts to unsubscribe from.
Contracts to unsubscribe*	40*20	Ρ	AN	U	FG603 ALSI, FG603 INDI, FG603 FINI	List of contracts names to unsubscribe from

Total Length: 802 Bytes

7.2.2 Option Contract Subscription – Message type 67

Sending this message type will result in the API user receiving Display Updates (Message Type 59) on the contracts listed in the Option Contract Subscription Message.

The following scenarios are catered for:

- If the message contains the future contract the user will be subscribed to all option strikes' depths on the future expiry.
- If the message is empty all the options on the market on which an order has been placed, will be subscribed to.
- If a single option is specified only this contract will be subscribed to.

When subscribing to a contract using the 67 message, further updates will be sent when activity is recorded on that contract. To receive an initial state of the contract in terms of market statistics the display file will contain the latest information for this contract. It is advised that the information in the display data download is used as an initial state of the contract, and that the 67 message is used to subscribe to further updates.

Name	Length	Туре	Description	Case	Example	Comment
Contract	20	Р	AN	U	FG503	See explanation above for
Name*					ALSI	implementation.

Total Length: 20 Bytes

7.2.3 Future Contract Subscription – Message type 99

Sending this message type will result in the API user receiving Display Updates (Message Type 59) on the contracts listed in the Future Contract Subscription Message. Up to 40 contracts are catered for in this message.

For the agricultural market, subscription to silo receipt spot trading display updates is possible by product only. This is done by listing a normalized contract name for the product, for intance: to subscribe to all white maze silo receipt spot contract updates, specify the contract name as follows:

B00000WMAZ

Name	Length	Туре	Description	Case	Example	Comment				
Quantity*	2	1	N	n/a	2	The number of contracts for request.				
Contracts	40*20	Р	AN	U	FG625	This field displays all				
Appendix K - JSE Derivatives Trading System API Page 6

-				
Requested For			ALSI,	the contract names
Display*			FG612 INDI	that have been
				requested.

Total Length: 802 Bytes

7.2.4 Option Statistics Request – Message type 135

The Option Statistics Request allows a user to receive a Display Update (Message Type 59) which will include information for all option contracts traded since the beginning of the trading session. Therefore statistics included in the Display Update Message such as volume, last price, days high and days low will be filled with the details for option contracts traded.

The contract name field of this message should be left empty when sending this request.

Name	Length	Туре	Description	Case	Example	Comment
Contract	20	Р	AN	U		See explanation above for
Name*						implementation.

Note regarding subscription and global sequence number

When subscribing to an update on a contract, the resulting 59 message will contain a global sequence number of the last global sequence number sent, and will not increment. Therefore 59 messages received as a reply to a subscription message (message type 99) should not be used as part of any global sequence number processing, as these updates do not fall in line with the normal sequence number series. Any subsequent 59 messages after subscription has been processed will continue with the normal global sequence number series.

7.3 Order Insert/Suspend/Cancel Messages

7.3.1 Suspend/Delete Active Order Message – Message type 8

The Suspend Order message informs the system to either suspend or delete the order with the specified exchange order sequence. The activity (suspend or delete) is controlled by the suspend / delete flag in the message. This message should be used for suspending or deleting orders which are currently on the order book as active.

Name	Length	Туре	Description	Case	Example	Comment
Exchange Order Sequence*	4	I	N	n/a	2563	Sequence number of order to suspend or delete
Contract Name*	20	Ρ	AN	U	FG503 ALSI	Name of contract on which order will be suspended. Only used for suspending an order.
Buy or Sell*	1	С	A	U	В	Indicates whether the order being suspended/deleted is a Buy(B) or Sell(S)
Suspend/Delete Flag*	1	С	A	U	S	S – Suspend, D - Delete

<u>3/10/1929/08/1</u> <u>913/07/17</u>9/01/17

Total Length: 26 Bytes

7.3.2 Delete Order Message – Message type 15

The Delete Order message allows the user to delete an order with the specified exchange order sequence which are either currently suspended or active. This message should be used for deleting orders which are currently suspended. This message cannot be used to delete orders which are currently active.

Name	Length	Туре	Description	Case	Example	Comment
Exchange	4	1	N	n/a	6262	Order Sequence
Order						number of order to
Sequence*						delete
Contract	20	Р	AN	U	FG503	Name of the contract
Name*					ALSI	which you would like
						to delete

Total Length: 24 Bytes

7.3.3 Resubmit Order Message – Message type 27

The Resubmit Order Message allows a user to resubmit a particular order with the specified order sequence number. This will submit the order onto the live trading screen, and a subsequent display update will be returned, if an error does not occur.

Name	Length	Туре	Description	Case	Example	Comment
Order Sequence number*	4	I	N	n/a	100015	Order Sequence number of suspended order to be resubmitted. This will make the suspended order an active order.
Contract Name*	20	Ρ	AN	U	FG503 ALSI	Name of the contract on the order which you would like to resubmit.

Total Length: 24 Bytes

7.3.4 Order Insert Message – Message type 56

- Order messages are stacked and 11 orders can be inserted on different contracts in one message.
- The message is preceded with a number of orders and a first order message, followed by the other orders that can be inserted.
 - The following fields apply to all orders:
 - Order Principal
 - o Order Type
 - o User Member
 - o User Dealer
 - o Order Timeout
 - o Cancel Flag
- The number of orders indicates the total orders to be inserted including the first order.

Exception Handling:

 When processing multiple order entries in this message, each order will be validated individually and processed. Order rejection messages (message type 126) will be returned for each order which is rejected, with an indication of the order reference and the error number and message. Orders which are successfully processed will be acknowledged with the appropriate file update message (message type 123).

<u>3/10/1929/08/1</u> <u>913/07/17</u>9/01/17

Order Type Definitions

- Iceberg Order The bid message has place for a quantity and Iceberg Quantity. When the Iceberg Order Type is selected an order with Quantity 10 and Iceberg Quantity 100, an order will be place on screen for a quantity of 10, and when hit, an order will automatically be submitted for a further 10 contracts, when this is hit another order will be submitted automatically etc. until the Iceberg Quantity of 100 is reached.
- At Best Order This order takes no price, and an order will be submitted onto the exchange automatically at the best price on top of the stack. The order price will follow the best price until completely satisfied.
- Stop Order This is an At Best Order and will follow the best price. If the market price goes below the stop price specified in the price field of the order message, the order will automatically be pulled.
- All Or Nothing This is an order which must be completely satisfied before it is removed from the stack. An order can therefore be submitted onto the system and will remain until completely satisfied.
- At Close Order This order is placed onto the system and only appears at market close. At the close of on screen trading period, all at close order orders are submitted onto the market and matched if possible.

7.3.5 Cancel All Active Orders Message – Message type 85

The Cancel All Active Orders Message allows a user to delete all active orders currently on the market. There are various options for cancelling all orders which are detailed in the Cancel Flag description.

Name	Length	Туре	Description	Case	Example	Comment
Contract Name	20	Ρ	AN	U	FG503 ALSI	Name of contract to be cancelled. Applicable only when Cancel Flag 0, 1, 2, 3
Cancel Flag*	2	I	N	n/a	4	See explanation below for implementation.
Buy Sell	1	С	A	U	B or S	Buy or sell side to cancel. Applicable only if Cancel Flag not 4.

Total Length: 23 Bytes

Name	Cancel Flag
Top Bid or Offer on Contract	0
All Bids or Offers on Contract	1
All Bids or Offers on all Expiries for Instrument	2
All Bids or Offers on Contract's market sector	3
All Bids and Offers on market	4

7.3.6 Reduce Active Order Quantity – Message type 104

The reduce order allows the user to decease the quantity of an order without changing the place in the stack.

Appendix K - JSE Derivatives Trading System API Document.docAppendix K - JSE Derivatives Trading <u>3/10/1929/08/1</u> <u>913/07/17</u>9/01/17 System API Document.docJSE Derivatives Trading stem API Document v2.1 rev2.doc

Total Length: 38 bytes

7.4 Report Only Messages

7.4.1 Split Deal Message – Message Type 22

The Split Deal Message allows a user to allocate a particular portion of a deal to a specified principle and/or sub account. The User Reference field allows the user to indicate what the user reference the resultant deals should have. It is important to consider the rules regarding principle / agency deals when allocating a deal. Deal legs with a Principle (P) capacity can be allocated at a different price to the original deal, however, deal legs with an Agency (A) capacity cannot.

It should be noted that the Split Deal Message is used for client or subaccount allocations. The Assign Deal Message is to be used for assigning trades to other members in the market.

Name	Length	Туре	Description	Case	Example	Comment
Deal Sequence*	4	I	N	n/a	3633	The deal sequence number to be allocated.
Quantity*	4	I	N	n/a	5	The quantity to be allocated.

Cumulate*	numbers of type I 4 long				2422, 5255	Maximum 100)

Total Length: 422 Bytes

- 7.4.3 Edit Report Only Deal Message type 26
 - Please see 7.4.4 for the structure of this message. This structure is the same as the unmatched deal structure, with the unmatched sequence being the unmatched deal sequence already booked. The details captured in this message will be used to modify the existing details of the specified unmatched sequence.

7.4.4 Insert Report Only Deal – Message type 28

The Insert Report Only Deal Message allows a user to capture a Report Only trade onto the market. A few important notes are to be considered with regards to the Counter party field on this message:

- If the counterparty field is a client code. The opposite leg of this transaction will automatically be booked, and matched.
- If the counterparty field is another member code, the opposite leg of this transaction will automatically be booked, and sent to the counterparty if the indicator "Single Leg" has been set to false. In this scenario the counterparty will receive a leg which is equal and opposite to that which the user captured, however, the price and rate fields

 Appendix K - JSE Derivatives Trading System API

 Document.docAppendix K - JSE Derivatives Trading
 3/10/1929/08/4

 System API Document.docJSE Derivatives Trading
 913/07/179/01/17

 System API Document.v2.1 rev2.doc
 913/07/179/01/17

of this leg will be 0. The counterparty will need to edit the unmatched leg (Message Type 26) before the match will take place. This allows the counterparty and user to agree on the price and/or rate of the transaction.

To confirm the entry of the unmatched trade before a match takes place, the Buy Sell field can be sent with a lower case b or s. This will allow the user to first accept (Message Type 40) the trade, before the match takes place.

The exchange has a limitation on the time in which 2 legs of a reported trade should match. This is usually in the region of 6 minutes.

The message layout for this message will use the same layout as that for message type 29 below.

7.4.5 Other Reported Transactions - Message type 29

Reporting Allocation Corrections

Allocation corrections allow a user to correct the principle code on a trade when the principle is a client code. This gives the user the opportunity to book a reported trade to move the trade to the correct client, or back to the member's account without incurring additional booking fees.

To report a trade which is an allocation correction the user must supply the following fields:

- Assign Sequence This must be filled with the Deal Sequence number of the trade to be corrected.
 - b. Reason This must be filled with the reason code 'L' Allocation Correction.

This will update the original trade with a deal origin of 'G' – Allocation Error, and will capture a new trade with the deal origin of 'I' – Allocation Correction. The Principle supplied should be the client code on the trade which you wish to correct, and the Counterparty supplied should be the client to which the trade should belong to. If you wish to move the trade to the members account, the Principle supplied should be the member's account, and the Counterparty supplied should be the client code which you wish to correct. The remainder of the fields should be captured as normal when reporting a trade to the exchange.

Reporting Roll Over Trades

If the user would like to report a roll over trade, i.e. a trade which reports a leg on the current expiry, and the opposite leg on a later expiry, the report only trade message can be used for this purposes.

It is important to note the difference between the "Roll Position" and this "Roll Over Trade" functionality. In the "Roll Over Trade" functionality there is no need to specify the link to an existing position. The "Roll Over Trade" functionality works as follows:

- A report only trade is captured for the current expiry against a selected counterparty. This trade is captured as any other normal report only trade. To indicate that this is a "Roll Over Trade", the Origin field in the message should be populated with the Origin "R" – Rolling Position.
- 2. A report only trade is then captured for the later expiry against a selected counterparty. This trade is captured as any other normal report only trade, and the origin should be "8" Report Only After Roll. PLEASE NOTE, that failing to specify this origin when reporting a roll over trade will result in the Report Only leg of the trade occurring supplementary fees. It is also important to note that the Origin "Report Only After Roll" is only for input use. The resulting trade confirmation message will indicate "P" Report Only.

It is important to note that the Origin "R" - Rolling Position, will only be accepted on the current expiry.

Reporting Trade Cancellations And Trade Corrections

When a user would like to cancel a trade, they can make use of the report only trade capture to cancel an existing trade. This is done by completing the details of a report only trade message with the same details as the original trade (except the Buy Sell is reversed). The origin on the report only message should be 'V' - Report Only Cancellation, and the Assign Sequence field should be filled in with the Deal Sequence number of the original deal. The counterparty on this message should be left empty, as the counterparty may not be known for onscreen transactions.

If the user would like to correct a trade, they are required to send the Report Only Cancellation (as above), and then follow it with a further report only message with the details of the corrected trade. In this message the origin should be 'U' - Report Only Correction.

Name	Length	Туре	Description	Case	Example	Comment

Additional User Reference*	10	Ρ	AN	U	12345ABC	Additional Reference which will appear on the resulting order and deal

Total Length: 62 Bytes

7.4.9 Unmatched Deal Accept – Message type 40

The Unmatched Deal Accept Message allows a user to accept a specified unmatched deal record. A deal must either have a lower case Buy Sell field for it to be accepted. When an unmatched deal is accepted and matches the counterparties leg of the unmatched deal, the unmatched deal will be deleted, and the relevant deal, completed order and position updates will be received. If the unmatched has not been matched, only an update will be received.

Name	Length	Туре	Description	Case	Example	Comment
Unmatched deal Sequence number*	4	I	N	n/a	1000015	Unmatched deal sequence number of unmatched deal to be accepted
Contract Name	20	Ρ	AN	U	FG503 ALSI	Name of the contract on which the unmatched deal was booked.

Total Length: 24 Bytes

7.4.10 Tri-part Deal Entry - Message type 62

Please refer to 7.4.4 for the message structure.

The purpose of this message is to allocate a deal to a client of another member. The unmatched message structure filled for this operation should be filled with the following specific information:

- Assign Sequence This should be the Deal Sequence number of the deal which is to be allocated.
- Counterparty This field should be filled with the client code of the other member to which the deal specified in the Assign Sequence is to be allocated to.

The unmatched message structure should therefore be filled with the information of the selected deal, specified by the deal sequence. The price and rate field allow the user to allocate the deal at a defined price and/or rate. The message also allows for the user to specify a new reference number for the resultant trade legs.

The deal specified in the Assign Sequence will be updated with an Origin of Tripartite Send. Once the counterparty's member accepts the trade, new trade legs will be booked with Origin Tripartite Send.

7.4.11 Assign Deal - Message type 64

Please refer to 7.4.4 for the message structure.

The Assign Sequence of this structure must be filled with the Deal Sequence of the deal which the user wants to assign.

The purpose of this message is to assign a deal leg to another member. The unmatched message structure filled for this operation should be filled with the following specific information:

- Assign Sequence This should be the Deal Sequence number of the deal which is to be assigned.
- Counterparty This should be filled with the Member Code of the counterparty to which the deal will be assigned to.

The unmatched message structure should therefore be filled with the information of the selected deal, specified by the deal sequence. The price and rate field allow the user to assign the deal at a defined price and/or rate.

The deal specified in the Assign Sequence will be updated with an Origin of Assign Send. Once the counterparty accepts the trade, new trade legs will be booked with Origin Assign Send. The message also allows for the user to specify a new reference number for the resultant trade legs.

7.4.12 Position Roll Forward – Message type 115

Please refer to 7.4.4 for the message structure.

The Position Sequence to Roll Forward of this structure must be filled with the Position Sequence of the position the user wants to roll forward. The Deal Price field of this structure must be filled with the price the user wants to close the current position at, and the Roll Forward Price field of this structure must be filled with the price the user wants to open the next position on. The Contract field of this structure must be filled with the Contract the user wants to open the next position on, (or Roll the position to).

The unmatched message should be filled with the following specific information other than that specified above:

 Quantity – The amount of the current position which should be rolled to the later expiry.

- Buy or Sell The action to be performed on the current expiry. To roll a negative (short) current position. The buy or sell field should be filled with a B (Buy). This will indicate your intention to buy some of your short position and sell into the later expiry.
- Counterparty This should be a member or client in the market which has indicated the intention to be the counterparty to this transaction.

The trades captured to close the current position on the existing expiry will be marked with the Origin "Rolling forward position". The trades captured to open the position on the later expiry will be market with the Origin "Report Only".

7.5 Entity Administration Messages

7.5.1 Change Member Message Subscription – Message Type 7

Please see Section 4.12 for details on the rules for using this message type.

The Change Member Message Subscription allows the user to control access to the system for a particular dealer. Only dealers with Master Dealer privileges will be able to set the subscription of other dealers in the member firm.

Name	Length	Туре	Description	Case	Example	Comment
Message Subscription Sequence	4	I	N	n/a	0	Not used for input purposes.
Member Code*	6	Р	AN	U	AAAA	Member code of logged in user.
Dealer Code*	4	Ρ	AN	U	ABC	Dealer code of logged in user.

Effective Group*	1	В	Ν	n/a	1 – True 0 – False	

Total Length: 21 Bytes

7.5.2 Change Member Limits – Message type 6

Please see Section 4.12 for details on the rules for using this message type.

The Change Member Limits Message allows users to edit the limits used for trading. Only dealers with Master Dealer privileges will be able to set the subscription of other dealers in the member firm.

PLEASE NOTE: If a blanket limit for a particular instrument type is submitted, any previous instrument specific limits will be removed from the exchange, and replaced with an entry for the instrument type. When this occurs the user is required to re-concile their limits with the exchange. To do this, please submit a File Download Request (Message Type 36) for type 24 (Dealer Risk Value Limits)

7.5.3 Create Client Message – Message type 102

The Create Client Message allows a user to create client accounts or client sub accounts. To create a client sub account, the Master Client's sequence number is filled into the Master Client Sequence field of this structure. This message can also be used to update the details of an existing client. To update a client, the Client Sequence Number is filled in with the particular client, and the Is An Update field set to true (1).

Name	Length	Туре	Description	Case	Example	Comment			
Client Sequence	4	1	N	n/a	2422	For Updates the sequence number of the client is required			
Master Client Sequence	4	1	N	n/a	6223	If this client is a sub account for another client, that client's sequence number is required.			
Member Sequence*	4	I	N	n/a	267	The sequence number of the member.

Must Deliver Today	1	В	N	n/a	1-True 0-False	Indicates if this certificate must be delivered today.
Quantity Remaining	4	N	N	n/a	5	Indicates how many contracts are remaining to be delivered on this receipt.
Date Valid Until	3*4	I	N	n/a	2012,05,01	Indicates the good till date for this receipt.
Sub Account	6	Р	A	n/a	SUB01	Sub account used for this silo certificate

Total Length: 163 Bytes

7.6.2 Edit Silo Certificate - Message type 131

Please see 7.6.1 for the message structure.

7.6.3 Delete Silo Certificate – Message type 136

Please see 7.6.1 for the layout of this message. The certificate number field must be that of the certificate you want to delete.

7.6.4 Verify Silo Certificate – Message type 129

Please see 7.6.1 for the layout of this message. Note that the same message is sent for the verification of a silo certificate, as that for a new silo certificate. To verify a silo certificate, the details of the certificate which you would like to verify must be sent in this message with a status field of 'V'. This will indicate your intention to verify the details of the certificate.

7.7 Request data retrieval

7.7.1 Request data retrieval - Message type 36

The Request Data Retrieval Message allows users to request data from the system. The Data Type field indicates what type of data should be returned. It is important to note that 256 must be added to the specific Data Type in order for the data to be returned. To download a specific record within a data set, the Specific Record field is filled with the sequence number of the record required. The Download Date field allows the user to request data for a specified date. This date can only be set to today or the previous business day. If no data is available for the request, and empty data set will be returned.

Name	Length	Туре	Description	Case	Example	Comment
Data Type*	2	I	N	n/a	5+256 (261, orders)	261 is equivalent to an Orders data download
Last Piece of Chunk	1	В	Ν	n/a	1	Not used for request
Re-request	1	В	N	n/a	True or false	Indicates if this is a re- request for data
Action	4	1	Ν	n/a		Not used for request
Specific Record	4	1	N	n/a	4664	Allows to download a specific record sequence number and onwards
Download	2	1	Ν	n/a	12743	Dos Date of days

Contract	20	Р	AN	U	FG503	Contract name of the
Name*					ALSI	contract on which you are
						requesting history.

Total Length: 20 Bytes

7.9 Heart Beats – Message type 84

This message contains only a header with message type 84. This message must be sent to the system to inform the system of the users open connection. This will allow the system to verify that the user is still connected, and has not lost connection to the system.

7.10 Client Margin Multiplication Factor - insert/edit/delete - Message type 150

This message contains the information to set, edit or delete the Client Margin Multiplication factor per instrument.

When a client has an additional multiplication factor set on an instrument, the margining process will add in the extra margin for the client, based on the multiplication factor for the instrument. By default all multiplication factors are set to 100 for all clients across all instruments. This functionality is used to override the defaults set.

This message is used by both Clearing Member systems and Member systems. Member users cannot make the Multiplication Factor higher than what the Clearing Member specified. Clearing Member can set the value higher or lower than that of the member.

For Setting the Member Margin Multiplier (Only Clearing Member users)

- The Client Sequence must be zero.
- All clients belonging to this member will have a Multiplier set to the value specified

For Setting the Client Margin Multiplier (Member and Clearing Member systems)

- The Member code must be set to the member of the client
- The Client code must be set to the client sequence that must be changed.

Process flow for Edit/Insert and Delete:

- If there is no multiplication factor set for the member-client-instrument combination then the record will effectively be a INSERT
- If the member-client-instrument combination does exist an EDIT will occur.
- If the multiplication factor is set to 100 a DELETE will occur on the member-clientinstrument combination.

If the message is accepted a 123 message will be sent with the updated details.

Total Length: 20 Bytes

7.11 Spot Trading Silo Certificates (Agricultural Market only)

Dealers can trade Silo Certificates, which have been approved for delivery by the exchange, on a spot market basis. Spot basis trading contracts are defined by the following parameters:

- The product/instrument on the Silo Certificate
- The Silo Location on the Silo Certificate
- The Grade of the grain on the Silo Certificate
- The Origin of the grain on the Silo Certificate
- The Receipt Number on the Silo Certificate.

Spot basis trading contracts follow the following naming scheme:

BXXXXXYYYY

- Where:
 - B is the identifier prefix for spot basis traded contracts
 - XXXXX is the sequence number of the contract, left padded with zero's to a lengh of five.
 - YYYY is the short name of the instrument or product on the spot basis contract.

The file structures specific to spot basis trading are the following:

- 1. Silo Certificate Spot Contract Number 120
- 2. Silo Certificate Active Spot Order Number 121
- 3. Silo Certificate Completed Spot Order Number 122
- 4. Silo Certificate Spot Deals Number 123
- 5. Silo Certificate Spot Unmatched Deals Number 124
- 6. Post-Delivery Run Deals Number 126

The input messages specific to spot basis trading are the following:

- 1. Spot Basis Order Insert Structure Message 57
- 2. Suspend/Delete Spot Basis Active Order Message 11
- 3. Delete/Suspend Spot Basis Order Message 19
- 4. Resubmit Spot Basis Order Message 32
- 5. Reduce Active Spot Basis Order Quantity Message 105
- 6. Edit Suspended Spot Basis Order Message 119
- 7. Delete Suspended Spot Basis Order By Sequence Number Message 139
- 8. Split Spot Basis Deal Message 23
- 9. Insert Report Only Spot Basis Deal Message type 166
- 10. Edit Report Only Spot Basis Deal Message type 167
- 11. Unmatched Spot Basis Deal Accept Message type 168
- 12. Unmatched Spot Basis Deal Assign Message type 169

Subscription to public messages/depth updates on spot basis contracts occur by product (see section 7.12.1). Submission of orders, order management operations and deal management operations occur through the normal submission of message structures conforming to the layouts outlined in the sections below.

Appendix K - JSE Derivatives Trading System API Document.docAppendix K - JSE Derivatives Trading System API Document.docJSE Derivatives Trading System API Document.v2 1 rev2 doc

7.11.1 Spot Basis Trading - Contract subscription mechanism

Subscription to public messages/depth updates on spot basis contracts occur by product only, by specifying a zero contract sequence number and the desired product. For example, to subscribe to all public messages for WMAZ spot basis contracts send a Future Contract Subscription Message (type 99) with the following contract name: B00000WMAZ.

7.11.2 Spot Basis Order Insert Structure - Message 57

Unlike future order inserts (message type 56) $_{\rm s}$ spot basis orders can only be submitted one per message, of which the structure is shown below.

Spot basis contract creation

Unlike future contracts, spot basis contracts are created based on market demand. Therefore any spot basis order insert message will actually create a tradable contract if a contract with the defining parameters mentioned in 7.12 does not already exist. The creation of a contract is confirmed to the market with a public file update message of file type Silo Certificate Spot Contract – Number 120

Name	Length	Туре	Description	Case	Example	Comment

7.11.7 Delete Suspended Spot Basis Order By Sequence Number - Message 139

The Delete Suspended Spot Basis Order message allows the user to delete an order with the specified exchange order sequence which are either currently suspended or active. This message should be used for deleting orders which are currently suspended. This message cannot be used to delete orders which are currently active.

Name	Length	Туре	Description	Case	Example	Comment
Exchange Order Sequence*	4	I	Ν	n/a	6262	Order Sequence number of order to delete
Contract Name*	20	Ρ	AN	U	B00122WMAZ	Name of the contract which you would like to delete

Total Length: 24 Bytes

7.11.8 Edit Spot Active Order By Active Order Sequence Number- Message type 163

The edit spot active order by active order sequence number message allows users to edit the details of an existing spot basis active order with a single message. The exchange will automatically replace the details of the active order with the details supplied in this message.

Name	Length	Туре	Description	Case	Example	Comment		
Contract Name*	20	Ρ	AN	n/a	B00122WMAZ	Contract of order to be edited. This must remain the same as the original order.

Total Size:74 bytes.

7.11.11 Insert Report Only Spot Basis Deal - Message type 166

The Insert Report Only Spotbasis Deal Message allows a user to capture a Spot Basis Report Only trade onto the market. A few important notes are to be considered with regards to the Counter party field on this message:

- If the counterparty field is a client code. The opposite leg of this transaction will automatically be booked, and matched.
- If the counterparty field is another member code, the opposite leg of this transaction
 will automatically be booked, and sent to the counterparty if the indicator "Single Leg"
 has been set to false. In this scenario the counterparty will receive a leg which is
 equal and opposite to that which the user captured, however, the price and rate fields
 of this leg will be 0. The counterparty will need to edit the unmatched leg (Message
 Type 26) before the match will take place. This allows the counterparty and user to
 agree on the price and/or rate of the transaction.

To confirm the entry of the unmatched trade before a match takes place, the Buy Sell field can be sent with a lower case b or s. This will allow the user to first accept (Message Type 168) the trade, before the match takes place.

The exchange has a limitation on the time in which 2 legs of a reported trade should match. This is usually in the region of 6 minutes.

The message layout for this message will use the same layout as that for file type 124 Spot basis unmatched deal (see <u>section 9.5</u>5).

7.11.12 Edit Report Only Spot Basis Deal - Message type 167

 Please see section 9.55 for the structure of this message. This structure is the same as the unmatched spot basis deal structure, with the unmatched sequence being the unmatched deal sequence already booked. The details captured in this message will be used to modify the existing details of the specified spot unmatched sequence.

7.11.13 Unmatched Spot Basis Deal Accept – Message type 168

The Unmatched Spot Basis Deal Accept Message allows a user to accept a specified spot basis unmatched deal record. A deal must either have a lower case Buy Sell field for it to be accepted. When an unmatched deal is accepted and matches the counterparties leg of the unmatched deal, the unmatched deal will be deleted, and the relevant deal, completed order and position updates will be received. If the unmatched has not been matched, only an update will be received.

						booked.

Total Length: 24 Bytes

7.11.14 Unmatched Spot Basis Deal Assign - Message type 169

Please refer to section 9.55 for the message structure.

The Assign Sequence of this structure must be filled with the Deal Sequence of the deal which the user wants to assign.

The purpose of this message is to assign a deal leg to another member. The unmatched message structure filled for this operation should be filled with the following specific information:

- Assign Sequence This should be the Deal Sequence number of the deal which is to be assigned.
- Counterparty This should be filled with the Member Code of the counterparty to which the deal will be assigned to.

The unmatched message structure should therefore be filled with the information of the selected deal, specified by the deal sequence. The price and rate field allow the user to assign the deal at a defined price and/or rate.

The deal specified in the Assign Sequence will be updated with an Origin of Assign Send. Once the counterparty accepts the trade, new trade legs will be booked with Origin Assign Send. The message also allows for the user to specify a new reference number for the resultant trade legs.

7.11.15 Delete Spot Unmatched Deal – Message type 170

The purpose of this message is to delete a spot unmatched deal.

Name	Length	Туре	Description	Case	Example	Comment

Phantom					false	element is a phantom

Total Length: 38 Bytes

**Please note that if the contract is Anonymous that the length byte will be 0 followed by 4 bytes indicating the Unique member number.

Included in the message are a number of the above Depth Data messages where the number is "Number of depth" in the first part of the message.

A note on receiving Display Update Messages (Message Type 59):

- A display update message will be received with a unique global sequence number. If a 59 message is received as a result of a trade, then a further 59 message will be received as an update to a particular global sequence number. This update message will contain the latest open interest and volume figures for that contract. These are published as updates to a 59 message, and therefore may contain a global sequence number which you have already received. Any 59 messages received with a global sequence number which you have already processed should be treated as updates and processed as such. Multiple updates can be received for a particular global sequence number. For example if a trade is captured for 100 contracts, and this is made up of 5 legs of 20 contracts each, 5 updates will be received on the global sequence number for that trade. These updates are due to volume and open interest updates.
- The depth received on the display update message will display all orders on the order book. The top of the depth will indicate the order which is currently the best order on the market. There may however be orders at the same price going down the depth. The discretion is up to the user whether to cumulate the quantity on the top of the depth to indicate the total quantity available at that price.

Please note the following when handling display update messages on **Dividend Neutral** contracts:

- When a trade occurs on a Dividend Neutral contract Display update messages will be sent for the Dividend Neutral Contract itself, the underlying Single Stock Future Contract, and the Dividend Future Contract.
 - The following should be noted for the Dividend Neutral Contract display update messages:
 - The High, Low, Last, Last Traded Time and Volume will be updated on this contract when a trade occurs.

 Appendix K - JSE Derivatives Trading System API

 System API Document.v2.1 rev2.doc
 913/07/17

- No trades will however be recorded on this particular contract itself. The above field updates are purely to indicate the market statistics on the Dividend Neutral Contract.
- 2. The following should be noted for the underlying Single Stock Future display update messages:
 - The High, Low, Volume and Open Interest will be updated when a trade occurs on the Dividend Neutral Contract.
- 3. The following should be noted for the underlying Dividend Future display update messages:
 - The trade will be concluded at a 0 price, and would update the Low of the contract (if applicable) when a trade occurs on the Dividend Neutral Contract.
 - The volume and open interest will also update.

8.4 Info and Error Return Messages – Message 125

Please see section 11 for the details of the error messages. Please note that the Information and Error return message is a variable length message, which defines a variable length Message field with a maximum length of 251.

Name	Length	Туре	Description	Case	Example	Comment
Error Number	4	Ι	N	n/a	12	This is the error
						number of the
						associated error
						message.
Information or	1	В	N	n/a	1 or 0	0 – information
error indicator						message
						1 – error message
Message	25 <u>0</u> 1	Р	AN	n/a	Fill or Kill	A Description of the
					order could	error. A Description
					not be filled	of the error

						number

Formatted

Total Length: Variable length with maximum of 2596056 Bytes

8.5 Order Rejection Message – Message 126

Please see section 11 for the details of the error messages. This message is returned as a negative response to a Multi Bid message (message type 56). This indicates the order reference of the order in the multi bid message which has been rejected. Please note that the Information and Error return message is a variable length message, which defines a variable length Message field with a maximum length of 251.

Name	Length	Туре	Description	Case	Example	Comment
Error Number	4	1	N	n/a	12	This is the error number of the associated error message.
Order Reference	10	Ρ	AN	n/a	A1122322B	The order reference of the order which has been rejected.
Error Message	255	Ρ	AN	n/a	Fill or Kill order could not be filled	A Description of the error

8.6 Daily Trend Reply – Message 61

The Daily Trend Reply indicates to users what on screen trade activity has been recorded on a particular contract. The response to this message is compressed. And the decompressed data will contain the following layout. The below structure allows for up to 1000 History Suffix items. If there are more than 1000 trades captured on a particular contract, multiple Message Type 61 messages will be sent in response to the request to cater for the full range of the days trades.

Name	Length	Туре	Description	Case	Example	Comment
Contract	20	Р	AN	U	FK721 ALSI	Contract code of requested history contract
History suffix	16*1000	History Suffix	n/a	n/a		Array of daily trend suffixes

7	Market closed (Admin period)
8	Market offline

8.9 Failure Messages

<u>3/10/1929/08/1 913/07/17</u>9/01/17

In the event that the exchange system fails the following message types should be noted, and the appropriate actions taken from the user.

8.9.1 Notification of failure (Message 127)

The following message will be sent on the event of a failure of the exchange trading system, or in the event of the recovery of the exchange trading system.

Name	Length	Туре	Description	Case	Example	Comment
Failure Notice Identifier	4	1	N	n/a	1 – Market Shard has failed 2 – Market Shard has recovered	Identifier to identify if a market shard has failed or recovered.
Market Number	4	I	N	n/a	1 – EDM 2- APD 4 – Global	Indicates the market number on which a particular market shard has failed.
Market Shard Number	4	Ι	N	n/a	1	Indicates the market shard which has failed. This can be mapped to the Instrument Data Download to indicate which instruments are affected.
Unused	243	В	n/a	n/a		

Total Length: 255 Bytes

8.9.2 Failover recovery response (Message 37)

The failover recovery response message will be published automatically to all connected users to update their transactional data (Active Orders, Deals, Completed Orders, Positions and Unmatched) in the event of the recovery of a Market Shard, post a failure. This message can be used to update any transactional data which may have been affected by the recovery of a market shard.

The message definition is the same as the Download Data Response (Message 36), and should be processed the same. PLEASE NOTE: In the case of large data transmissions the flag "Another Set to Come" could be set to true. In this case the normal download data request message 37 should be sent by the user to retrieve the next set of data. E.g.

API Application		Exchange System
	←	Exchange systems send message type 37 with Another Set to Come set to True.
API system sends message type 37 with Re-Request flag set to True to request the

9. Download data structures

The following structures are received when downloading data. Example of this process can be found in Section 6

All these Messages are compressed

9.1 Request Data Header – Message Type 36 and 123

Please see Section 4.7 for the handling of this message.

The Request Data Header will be attached to all 36 and 123 message received by the user. This indicates the Data Type received. For 123 messages the Specific Record and Action fields are filled to indicate the specific record received and the action to be taken.

Name	Length	Туре	Description	Case	Example	Comment
Data	2	1	Ν	n/a	5	When

 913/07/179/01/17

group can be determined by going to the specified record in the Group Definition data to which this instrument points to in the Instrument Group Sequence field.

The Fee details applicable to this instrument for Futures, Options and Deliveries are defined by going to the appropriate record in the Fee Data record pointed to by the Future Fee Sequence, Option Fee Sequence and Delivery Fee Sequence fields of this structure.

The market shard number will identify the market sub set on which particular contracts can be found. PLEASE NOTE: The exchange may at any time change the market shard definition of an instrument, and it is the users responsibility to handle this change without prior notice by the exchange.

Fee Delta	8	D	N	n/a	0.506	For option completed orders indicates the delta of the option to be used for fee purposes.

Total Length: 369 Bytes

9.11 Deals data - Number 8

The Deals Data defines what deals have been done for a particular user. When receiving a deal entry each entry will contain an Exchange Reference Number. This identifies the deal as recorded by the exchange. This Exchange Reference number will be accompanied with an Exchange Suffix field. This Exchange Suffix field is the version of the particular exchange reference number. When the deal is initially entered the Exchange Suffix will be 0, when further deal management activity is performed on this deal, the Exchange Suffix will be incremented. The uniqueness of an Exchange reference is therefore determined by both the Exchange Reference and Exchange Suffix on the deal.

Deals created as a result of end of day operations are identified by the Exchange Reference indicator of "DELIVERY", "AUTOCLOSE", "AUTOCLOSF" or "CORPORATE". "DELIVERY" indicates a deal used to indicate a physical position on an agricultural product. These are generated during the processing of physical deliveries. "AUTOCLOSE" or "AUTOCLOSF" indicates a deal used to close out a position on a contract on future's expiry. These deals are generated during the end of day process on a futures close out day. "CORPORATE" indicates a deal used to effect a corporate action. These deals are generated during the end of day process when a corporate action is scheduled.

Name	Length	Туре	Description	Case	Example	Comment

Can Change	1	В	n/a	n/a	1 – True 0 – False	The indicates if the dealer has rights to change his subscription to the message
Group Rights	1	В	n/a	n/a	1 – True 0 – False	This indicates if the group to which this dealer belongs has rights to the message.

Total Length: 21 Bytes

9.25 Group Definition data – Number 78

The Group Definition Data defines the group setup for instruments. The Next Group Sequence points to the next level in this group. The instrument which then links to that group sequence is defined as being part of the group setup. The Next margin field indicates the margin amount applicable to the next level of grouping. For example ALSI (Instrument Seq 1 may point to Group Sequence 2, Group Sequence 2 may have a Next Group Sequence of 3, INDI Instrument Sequence 5 may point to Group Sequence 3, thus ALSI (1) and INDI (5) belong to the same group.

Name	Length	Туре	Description	Case	Example	Comment

9.54 Silo Certificate Spot Deals – Number 123

The Silo Certificate Deals Data defines what deals have been done for a particular user. When receiving a deal entry each entry will contain an Exchange Reference Number. This identifies the deal as recorded by the exchange.

Deals created as a result of end of day operations are identified by the Exchange Reference indicator of "DELIVERY", "AUTOCLOSE", "AUTOCLOSF" or "CORPORATE". "DELIVERY"

 913/07/179/01/17

indicates a deal used to indicate a physical position on an agricultural product. These are generated during the processing of physical deliveries. "AUTOCLOSE" or "AUTOCLOSF" indicates a deal used to close out a position on a contract on future's expiry. These deals are generated during the end of day process on a futures close out day. "CORPORATE" indicates a deal used to effect a corporate action. These deals are generated during the end of day process when a corporate action is scheduled.

10. SSF Auto Quote

10.1 Auto Quote Message - Message type 121

In essence, the Auto Quote component is responsible for submitting a Bid message (message type 56) on behalf of a Trader. The parameters of this Bid message are calculated by using the current Buy and Sell quantities and prices (as received via JSESETS) and the parameters provided by the Trader (see table below).

To Start Quoting on a particular contract, the user would send this message with the Buy or Sell or Double parameter indicting the users quote option. To stop quoting on a particular contract this message can be used with a Buy or Sell or Double field with N (None). Auto Quote Trading (Private) Message

Name	Length	Туре	Description	Case	Example	Comment
Contract Name*	20	Ρ	AN	U	FG503 ALSI	Indicates which instrument the user would like to auto- quote on.
(B)uy Or (S)ell Or (D)ouble Or (N)one*	1	С	A	UL	В	Indicates what type of order should be submitted by the auto- quote engine. N will stop quoting on a contract.
Deals Principal*	8	Ρ	A	U	ABC678	Indicates what principle should be used for orders submitted by the auto-quote engine.
User Reference*	10	Ρ	AN	UL	MYREF001	Indicates what reference number should be used for orders submitted by the auto-quote engine
User Dealer*	4	Ρ	A	U	XXZ	Indicates what dealer code should be used for orders submitted by the auto quote engine.
User Member*	6	Ρ	A	U	AAAA	Indicates what member code should be used for orders submitted by the auto quote engine.
Buy Interest Rate	8	D	N	n/a	2	Indicates what interest should be added for buy orders submitted by the auto quote engine
Sell Interest Rate	8	D	N	n/a	2	Indicates what interest should be added for sell orders submitted by the auto quote engine.
Dividend*	8	D	N	n/a	1	The dividend portion of the price to subtract.
Trade Fee*	8	D	N	n/a	1	Fee portion per trade to be added to price

11. Futures Close Out Iteration Minute by Minute

11.0 Overview

The functionality provided by the exchange provides for the publishing of minute by minute prices of the index and the index constituents, as they are calculated during the futures close out iteration period.

These prices, together with a rolling average will then be published to users who have subscribed to receive this information. The user can select to start or stop receiving prices at any time during the futures close out iteration. The prices published will be from that minute onwards, and the average price published will be inclusive of the period already covered during the futures close out iteration, and will be up to date.

11.1 Subscription – Message Type 142

Users will be able to select to subscribe to the Index prices, or both the Index prices and the prices of each of the Index Constituents.

The subscription message can be used to subscribe or unsubscribe to receive futures close out prices. If the user would only like to see the values for the Index contracts they should only set the "Index Prices Subscription" field to True, and the "Index Constituent Prices Subscription" to False. At any time the user can select to stop or start receiving this information. The subscription message will be formatted as follows:

Name	Length	Туре	Description	Case	Example	Comment
Index Prices Subscription	1	В	N	n/a	1 – True 0 - False	Indicates if you would like to subscribe to the Index values
Index Constituent Prices Subscription	1	В	Ν	n/a	1 – True 0 - False	Indicates if you would like to subscribe to the Index Constituent values

11.2 Futures Close Out Prices

Prices will be published in 2 formats, Index Prices and Index Constituent Prices. These are received independently of one another.

11.2.1 Index Price Item – Message Type 143

Name	Length	Туре	Description	Case	Example	Comment
Index Code	10	Ρ	AN	U	J200	Code of the Index Contract
Time Interval	4	В	N	n/a	10, 54, 55, 0	Time of the index price
Index Value	8	D	N	n/a	20150.00	Value of this minutes index price
Index Rolling Average	8	D	N	n/a	21510.00	Latest average of the index contract

14. Distribution

List the names and divisions/departments of the persons to whom this document will be distributed. It is not necessary to include designations.

Name	Department
M. Janke	STT
Glenda De Wet	JSE
Arlette Macfarlane	JSE
Matthias Kempgen	JSE

15. Glossary

Term	Definition
A	Alpha only
A	Alpha only
ACK	Acknowledgement
AN	Alpha numeric
В	The field is made up of 1 or more bytes of type U
С	Single character ASCII equivalent
D	Intel/IEEE floating point 8 byte format
FF	Hex for 255
FOK	Fill or Kill
	Intel Integer format; the length is defined
LZH	Compressed file format
JSE DERIVATIVES MARKETS TRADING SYSTEM REPLACEMENT	Multiple Instrument Trading System
MTM	Market to Market
Ν	Numeric only - Default for types I.U.D
NACK	Negative Acknowledgement
NOB	Number of bids
Ρ	Pascal type string with leading length byte, maximum length is the defined length – 1. All strings in JSE DERIVATIVES MARKETS TRADING SYSTEM REPLACEMENT are represented in this manner
TCP / IP	Transmission Control Protocol / Internet Protocol
TOK	Take or Kill
U	Intel unsigned integer; the length is defined
URL	Uniform Resource Locator
XOR	Mathematical term for exclusive disjunction
Information Subscriber	Those entities which will be subscribing to the public data for their own use, and onward redistribution to their external clients.
